Package 'CB'

September 8, 2015

Title Cole Brokamp's Personal Functions

Version 0.1

Description Cole's personal R functions

Depends R (>= 3.1.2)

Imports parallel,
XML,
RCurl,
pbapply

License GPL

LazyData true

R topics documented:

`CBapply` *CB's Custom Apply Function*

Description

This function is a wrapper for sapply with simplify=FALSE and USE.NAMES=TRUE. It then rbinds via do.call to return data.frame. In order for the names to work properly, a function that returns a data.frame must be used (see example).

Usage

```
CBapply(X, FUN, output = "data.frame", num.cores = 1, ...)
```

Arguments

X	List of objects to apply over
FUN	Function to apply
output	Output type. Defaults to 'data.frame', but can also be set to 'list' to suppress rbinding of the list.
num.cores	Defaults to 1 and the base 'sapply' is used. If set to greater than one, then it is the number of cores used in parallel::mclapply().
...	Additional arguments to the function

Examples

```
X <- as.data.frame(matrix(runif(100),ncol=10))
names(X) <- LETTERS[1:10]
CBapply(X,mean)
# function must return a data.frame with named columns for column names to work
CBapply(X,function(x) data.frame('mean'=mean(x)))
```

---

getPackages *getPackages*

Description

This function takes a package and returns a list of its dependencies. Good for downloading source files of packages to install on a R server where internet access is blocked.

Usage

```
getPackages(packs)
```

Arguments

packs	a quoted package name or list of package names

Examples

```
## Not run:
# use this to get specifically named packages and their dependencies:
packages <- getPackages('pbapply')
# use this to get all packages installed on local machine and their dependencies:
# packages <- getPackages(row.names(installed.packages()))
# then download the packages:
download.packages(packages, destdir='.',type='source')

## End(Not run)
```

LatLongToFIPS *Converting Lat/Long Coords into FIPS code*

Description

This function takes a latitude and longitude input numbers and returns the FIPS code by calling the Census Block Conversion API at the FCC.gov website. (See more details here: http://www.fcc.gov/developers/census-block-conversions-api)

Usage

```
LatLongToFIPS(latitude, longitude, census.year = "2010", showall = "false")
```

Arguments

latitude	Latitude coordinate
longitude	Longitude coordinate
census.year	Defaults to '2010'. Not tested on other years; shouldn't need to change as FIPS locations rarely change.
showall	Set to 'false' as defualt. Has to do with the FCC API; shouldn't need to change

Examples

```
LatLongToFIPS(latitude=39.135398,longitude=-84.519902)
```

ORGetter *Retreive Odds Ratio Table from Logistic GLM Objects*

Description

This function returns a data.frame of the odds ratios and their 95% confidence intervals.

Usage

```
ORGetter(logistic.glm, digits = 2, sig.star = TRUE,
  show.intercept = FALSE)
```

Arguments

logistic.glm	A logistic GLM R object. If not an object of 'glm' and 'lm', it will stop with an error.
digits	Number of digits to round table
sig.star	Will return an extra column with a star if the confidence interval does not contain 1. Defaults to TRUE.
show.intercept	Will show the intercept and its confidence interval only if set to TRUE. Defaults to FALSE.

Examples

```
## Not run:  x1 <- rnorm(100)
x2 <- rnorm(100)
y <- rbinom(100,1,prob=0.3)
logistic.model <- glm(y ~ x1 + x2,family='binomial')
ORGetter(logistic.model)

## End(Not run)
```

`save_pdf` *save_pdf*

Description

Copies the graphics contents of current device to PDF (a wrapper for `dev2.pdf`). Default size is 8.5 x 11 in landscape mode.

Usage

```
save_pdf(file, width = 11, height = 8.5)
```

Arguments

`file`	filename to save the image
`width`	width of pdf image
`height`	height of pdf image

`SPapply` *SPapply*

Description

*apply function for spatial point objects

Usage

```
SPapply(sp.object, FUN., ..., id.row.names = FALSE)
```

Arguments

`sp.object`	a SpatialPoints or SpatialPointsDataFrame object
`FUN.`	function to be applied; must take sp.object as first argument and must return a data.frame
`...`	additional arguments passed to function
`id.row.names`	if `TRUE`, set row.names of output data.frame from `data$id` of `sp.object`

Value

data.frame of all results from function applied to sp.object

tableSummary *Summary Table*

Description

This function summarizes numerical and dichotomous variables only. The summary number is either the mean of a numeric variable for the number and percentage of values that are the second of the two factors in a dichotomous variable. Missing values are removed before the summary statistic is calculated and the numer of missing observations is also presented in the table.

Usage

```
tableSummary(x, digits.mean = 2, digits.percentage = 0)
```

Arguments

x	Vector of data which to summarize. Should be used for numerical and dichotomous variables only.
digits.mean	The mean is rounded and displayed using this many digits.
digits.percentage	The percentage is rounded and displayed using this many digits.

Examples

```
X <- data.frame('some.continuous'=runif(300),'some.factor'=factor(rbinom(300,1,0.3)))
tableSummary(X$some.continuous)
# use CBapply to create a table
CBapply(X,tableSummary)
# specify the digits differently to change the display of the table
CBapply(X,tableSummary,digits.mean=3,digits.percentage=2)
```

tableTest *Table Test*

Description

This function summarizes and tests the differences of numerical and dichotomous variables only across some factor. The summary number is either the mean of a numeric variable for the number and percentage of values that are the second of the two factors in a dichotomous variable. Missing values are removed before the summary statistic, but the number missing is not reported. Furthermore, a p-value is reported testing the differences of the means or counts across the groups factor. The p-value is derived from an ANOVA for continuous variables or from a chi-squared test via monte-carlo simulation using 100,000 bootstrap replicates.

Usage

```
tableTest(x, group, digits.mean = 2, digits.percentage = 0)
```

Arguments

x	Vector of data which to summarize. Should be used for numerical and dichotomous variables only.
group	The factor for which to test the x variable across.
digits.mean	The mean is rounded and displayed using this many digits.
digits.percentage	The percentage is rounded and displayed using this many digits.

Examples

```
X <- data.frame('some.continuous'=runif(300),'some.factor'=factor(rbinom(300,1,0.3)))
X$some.other.factor <- factor(rbinom(300,1,0.5))
tableTest(x=X$some.continuous,group=X$some.other.factor)
tableTest(x=X$some.factor,group=X$some.other.factor)
CBapply(X[ ,c('some.continuous','some.factor')],tableTest,group=X$some.other.factor)
```
