Package 'CB'

August 26, 2015

Title Cole Brokamp's Personal	1 Functions	
Version 0.1		
Description Cole's personal R	functions	
Depends R (>= 3.1.2)		
Imports parallel, XML, RCurl		
License GPL		
LazyData true		
R topics documented	d:	
getPackages LatLongToFIPS ORGetter save_pdf tableSummary		1 2 3 3 2 4 4 5 5
CBapply	CB's Custom Apply Function	

Description

This function is a wrapper for sapply with simplify=FALSE and USE.NAMES=TRUE. It then rbinds via do.call to return data.frame. In order for the names to work properly, a function that returns a data.frame must be used (see example).

Usage

```
CBapply(X, FUN, output = "data.frame", num.cores = 1, ...)
```

2 getPackages

Arguments

X List of objects to apply over

FUN Function to apply

output Output type. Defaults to 'data.frame', but can also be set to 'list' to suppress

rbinding of the list.

num.cores Defaults to 1 and the base 'sapply' is used. If set to greater than one, then it is

the number of cores used in parallel::mclapply().

... Additional arguments to the function

Examples

```
X <- as.data.frame(matrix(runif(100),ncol=10))
names(X) <- LETTERS[1:10]
CBapply(X,mean)
# function must return a data.frame with named columns for column names to work
CBapply(X,function(x) data.frame('mean'=mean(x)))</pre>
```

getPackages getPackages

Description

This function takes a package and returns a list of its dependencies. Good for downloading source files of packages to install on a R server where internet access is blocked.

Usage

```
getPackages(packs)
```

Arguments

packs a quoted package name or list of package names

Examples

```
## Not run:
# use this to get specifically named packages and their dependencies:
packages <- getPackages('pbapply')
# use this to get all packages installed on local machine and their dependencies:
# packages <- getPackages(row.names(installed.packages()))
# then download the packages:
download.packages(packages, destdir='.',type='source')
## End(Not run)</pre>
```

LatLongToFIPS 3

LatLongToFIPS	Converting Lat/Long Coords into FIPS code	

Description

This function takes a latitude and longitude input numbers and returns the FIPS code by calling the Census Block Conversion API at the FCC.gov website. (See more details here: http://www.fcc.gov/developers/census-block-conversions-api)

Usage

```
LatLongToFIPS(latitude, longitude, census.year = "2010", showall = "false")
```

Arguments

latitude Latitude coordinate

longitude Longitude coordinate

census.year Defaults to '2010'. Not tested on other years; shouldn't need to change as FIPS

locations rarely change.

Set to 'false' as defualt. Has to do with the FCC API; shouldn't need to change

Examples

showall

LatLongToFIPS(latitude=39.135398,longitude=-84.519902)

ORGetter Retreive Odds Ratio Table from Logistic GLM Objects	
--	--

Description

This function returns a data.frame of the odds ratios and their 95

Usage

```
ORGetter(logistic.glm, digits = 2, sig.star = TRUE,
    show.intercept = FALSE)
```

to FALSE.

Arguments

logistic.glm A logistic GLM R object. If not an object of 'glm' and 'lm', it will stop with an error.

digits Number of digits to round table

sig.star Will return an extra column with a star if the confidence interval does not contain 1. Defaults to TRUE.

show.intercept Will show the intercept and its confidence interval only if set to TRUE. Defaults

4 tableSummary

Examples

```
## Not run: x1 <- rnorm(100)
x2 <- rnorm(100)
y <- rbinom(100,1,prob=0.3)
logistic.model <- glm(y ~ x1 + x2,family='binomial')
ORGetter(logistic.model)
## End(Not run)</pre>
```

save_pdf

save_pdf

Description

Copies the graphics contents of current device to PDF (a wrapper for dev2.pdf). Default size is 8.5 x 11 in landscape mode.

Usage

```
save_pdf(file, width = 11, height = 8.5)
```

Arguments

file filename to save the image

width width of pdf image height height of pdf image

tableSummary

Summary Table

Description

This function summarizes numerical and dichotomous variables only. The summary number is either the mean of a numeric variable for the number and percentage of values that are the second of the two factors in a dichotomous variable. Missing values are removed before the summary statistic is calculated and the numer of missing observations is also presented in the table.

Usage

```
tableSummary(x, digits.mean = 2, digits.percentage = 0)
```

Arguments

x Vector of data which to summarize. Should be used for numerical and dichotomous variables only.

digits.mean The mean is rounded and displayed using this many digits.

digits.percentage

The percentage is rounded and displayed using this many digits.

tableTest 5

Examples

```
X <- data.frame('some.continuous'=runif(300),'some.factor'=factor(rbinom(300,1,0.3)))
tableSummary(X$some.continuous)
# use CBapply to create a table
CBapply(X,tableSummary)
# specify the digits differently to change the display of the table
CBapply(X,tableSummary,digits.mean=3,digits.percentage=2)</pre>
```

tableTest

Table Test

Description

This function summarizes and tests the differences of numerical and dichotomous variables only across some factor. The summary number is either the mean of a numeric variable for the number and percentage of values that are the second of the two factors in a dichotomous variable. Missing values are removed before the summary statistic, but the number missing is not reported. Furthermore, a p-value is reported testing the differences of the means or counts across the groups factor. The p-value is derived from an ANOVA for continuous variables or from a chi-squared test via monte-carlo simulation using 100,000 bootstrap replicates.

Usage

```
tableTest(x, group, digits.mean = 2, digits.percentage = 0)
```

Arguments

x Vector of data which to summarize. Should be used for numerical and dichoto-

mous variables only.

group The factor for which to test the x variable across.

digits.mean The mean is rounded and displayed using this many digits.

digits.percentage

The percentage is rounded and displayed using this many digits.

Examples

```
X <- data.frame('some.continuous'=runif(300),'some.factor'=factor(rbinom(300,1,0.3)))
X$some.other.factor <- factor(rbinom(300,1,0.5))
tableTest(x=X$some.continuous,group=X$some.other.factor)
tableTest(x=X$some.factor,group=X$some.other.factor)
CBapply(X[ ,c('some.continuous','some.factor')],tableTest,group=X$some.other.factor)</pre>
```
